MR PEDRAZZINI ADVISES SENATORS MOLLAME AND CROATS TO USE OXYGEN OZONE THERAPY

10/2/20 – Italy-SIOOT

The news arrived that two senators of the Republic, Francesco Mollame and Marco Croatti, were positive at Covid.

While it is being discussed whether it is necessary to suspend the sessions that take place in the Senate, "Orbisphera" interviewed the Honorable Claudio Pedrazzini, the first member of parliament who tested positive at Covid in March this year.

You were the first positive MP at Covid. What do you feel like saying to your fellow senators?

I would like to wish my colleagues a speedy recovery. As you were the first Congressman to be infected with the virus, I recommend that you approach the quarantine period very carefully.

For our activity we deputies and senators come into contact with many people. We travel a lot. It is therefore very easy to contract the virus.

As far as treatment is concerned, I recommend following the instructions of doctors, because even in asymptomatic cases Covid can create problems. In this context I recommend Senators Mollame and Croatti to practice oxygen ozone therapy together with drug treatment. The experimentation in Italy and other countries has confirmed the effectiveness of ozone therapy in the various phases: pre, during and post Covid. It is a safe and risk-free practice.

Can you remind us what happened when you fell ill, and can you tell us how you were treated?

I was born, live and work in an area that was among the first red areas of the country. On March 6 and 7 I had a fever that came and went. On March 9 the fever of 37.5 degrees was constant. I took the test and tested positive. I informed the Chamber of Deputies and I locked myself in the house in quarantine.

In the following days the virus began to bite: high fever and shortness of breath. Together with the drug treatment I practiced oxygen ozone therapy, which I already knew. Prof. Marianno Franzini, international president of the Society of Ozone Oxygen Ozone Therapy (SIOOT), equipped with all safety measures, came home with great courage and practiced ozone therapy.

There is no doubt about the effectiveness of this practice. Within a week the fever dropped, all the values returned to normal, and above all I no longer suffered from lack of air.

With four sessions of oxygen ozone therapy, I was cured. I took two swabs and they both came back negative. I can say that the oxygen ozone therapy defeated the virus, reduced the quarantine time and also helped me in post Covid to overcome exhaustion and other problems resulting from the disease.

What are the reasons why I recommend ozone oxygen therapy to the two senators who tested positive for Covid?

I have experienced the benefits of ozone on my person. I can testify to its effectiveness. I have known for a long time the scientific literature and experiments in which the antiviral, antibacterial and anti-fungal characteristics of ozone are clearly confirmed. For this reason I have advised the Health Authorities and the Scientific Committee to also think about the use of ozone oxygen therapy to treat the sick and counteract the spread of Covid.

In recent months, several studies have been published in which it is reported how effective ozone oxygen is in curing Covid patients. For this reason I would recommend to deepen the knowledge and make it available to all patients infected with the virus.

You are a member of the XII Commission for Social Affairs which also deals with public health. On June 3rd the Commission heard in hearing Professors Marianno Franzini and Luigi Valdenassi, respectively international president and national president of SIOOT, and Arnaldo Andreoli, national vice-president of SIOOT and director of the UOC of Specialized Rehabilitation at the Sacco Hospital in Milan. The theme of the hearing was the ongoing trial for the treatment of Covid-19 patients. Members of Parliament who spoke showed considerable interest in ozone therapy. Are there any developments regarding the possible use of this practice?

The Parliament, and in particular the Commission of which I am a member, has continued the dialogue with the health authorities trying to deepen the knowledge and practice ozone therapy as a possible cure for Covid patients, which can also be used in the pre and post infection phase. I want to point out that oxygen ozone therapy is not an alternative to drug therapy, on the contrary, it can be said that ozone enhances and makes drugs more effective.

From this point of view I can say that a study path has begun to verify the effectiveness of ozone therapy associated with drug therapy. The study is carried out in collaboration between the Scientific Society of Ozone Ozone Therapy (SIOOT), the Italian Society of Infectious and Tropical Diseases (SIMIT) and the biopharmaceutical company Gilead Sciences. We expect positive surprises.
