  - And that's just the A's.

Post nasal drip  
Eczema  
Hives  
Cancer sores  
Stomachaches  
Headaches  
Insomnia  
Muscle cramps  
Hypersensitivity to loud noises and smells .....

ADD is diagnosed by observation from the Diagnostic and Statistical Manual of Mental Disorders, DSM-5

Hyperactive/impulsive type – six (or five for people over 17 years) of the following symptoms occur frequently:

- Fidgets with or taps hands or feet, or squirms in seat.
- Not able to stay seated (in classroom, workplace).
- Runs about or climbs where it is inappropriate.
- Unable to play or do leisure activities quietly.
- Always "on the go," as if driven by a motor.
- Talks too much.
- Blurts out an answer before a question has been finished (for instance may finish people's sentences, can't wait to speak in conversations).
- Has difficulty waiting his or her turn, such as while waiting in line.
- Interrupts or intrudes on others (for instance, cuts into conversations, games or activities, or starts using other people's things without permission). Older teens and adults may take over what others are doing.

Has child been checked for pin worms?

Movement of large muscles have been linked to ability to learn.

There is no lab test to diagnose ADHD. Diagnosis involves gathering information from parents, teachers and others, filling out checklists and having a medical evaluation (including vision and hearing screening) to rule out other medical problems. The symptoms are not the result of person being defiant or hostile or unable to understand a task or instructions.

Clayton's handwriting before and 2 months after he received treatment for inflammation stemming from poor nutrition, food allergies, fungus and lead.

It's easy to see the chaos Clayton's body was trying to overcome.

When a child is given an assignment in this state of chaos, there is a good chance they will act out in frustration with disruptive behavior and end up medicated on Ritalin or Adderall With side effects of anger, aggression etc.
